DECLARATION

I hereby declare that the project titled “Student Enrolment and Course Management System using Salesforce” is the result of my own work carried out as part of the Naan Mudhalvan Skill Development Program during my Bachelor of Computer Applications (BCA) course.

This project has been completed by me under the guidance and support provided through the Naan Mudhalvan Salesforce training program. I confirm that this work has not been submitted previously to any other university or institution for the award of any degree, diploma, or certification.

I also declare that all the information and resources used in this project have been properly acknowledged.

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to the Naan Mudhalvan initiative by the Government of Tamil Nadu for providing the opportunity to learn industry-relevant skills through the Salesforce training program. This program helped me gain practical knowledge and hands-on experience in Salesforce application development.

I would also like to thank my project mentor and instructors for their valuable guidance, continuous support, and encouragement throughout the completion of this project.

I extend my heartfelt thanks to the faculty members of the BCA department of my college for their support and for providing the necessary resources to successfully complete this project.

Finally, I would like to thank my family and friends for their motivation and encouragement during the preparation of this project.

STUDENT ENROLMENT & COURSE MANAGEMENT SYSTEM (SECMS)

1.INTRODUCTION

The Student Enrolment and Course Management System (SECMS) is a Salesforce-based application developed as part of the Naan Mudhalvan Skill Development Program. The main objective of this project is to simplify and automate the process of managing student enrolments, course details, and academic activities within an educational institution. Traditional enrolment systems often involve manual work, scattered data, and time-consuming processes, which can lead to errors and delays. This project provides a digital solution to manage these activities efficiently using the Salesforce platform.

The system allows administrators and enrolment officers to maintain student records, manage course information, and handle the enrolment process in an organized manner. Instructors can view course allocations and track the progress of enrolled students. By storing all information in a centralized system, the application ensures better data management, quick access to information, and improved communication between departments.

This project also uses important Salesforce features such as Flows, Validation Rules, Approval Processes, Reports, and Dashboards to automate different tasks and ensure that the enrolment process follows a structured workflow. These features help reduce manual effort, improve accuracy, and maintain transparency in the system.

Overall, the Student Enrolment and Course Management System provides a reliable and efficient way to manage academic enrolment activities. It helps educational institutions streamline their operations, improve data accuracy, and monitor important information such as student enrolment status, course availability, and overall academic performance.

1.1 PROJECT OVERVIEW :

The **Student Enrolment and Course Management System (SECMS)** is a Salesforce-based application developed to simplify and automate the academic enrolment activities of an educational institution. This system helps administrators, enrolment staff, and instructors manage student information, course details, enrolments, instructor allocations, approval workflows, payments, and reports in one integrated Salesforce platform.

The main objective of this project is to organize and store all information related to students, courses, and enrolments in a centralized system. This ensures quick access to data, well-structured processes, and reliable reporting. Enrolment Officers can efficiently handle student admissions, course registrations, and communication with students, while instructors and administrators receive complete visibility into course assignments and academic activities.

Additionally, the system supports automated instructor allocation, task generation, validation rules, and multi-level approval workflows for managing student enrolments. By utilizing Salesforce features such as **Flows, Approval Processes, Validation Rules, Reports, and Dashboards**, the institution can ensure that every stage of the enrolment lifecycle—from admission to course completion—is managed efficiently. The platform also allows continuous monitoring of important metrics such as total enrolments, generated revenue, distribution of student status, and pending approval requests.

1.1 PURPOSE :

The main goal of the Student Enrolment and Course Management System (SECMS) is to eliminate manual and disconnected enrolment procedures by introducing a reliable and automated Salesforce solution.

The system is designed to ensure:

- Proper and organized management of student information
- Well-defined workflows for course enrolment
- Automated validation and approval mechanisms
- Clear reporting and real-time monitoring of academic operations

1.2 SCOPE OF THE PROJECT :

The Student Enrolment and Course Management System (SECMS) developed using the Salesforce platform focuses on improving and simplifying the academic enrolment process within an educational institution. The scope of this project includes managing student records, course information, enrolment activities, instructor assignments, and monitoring academic progress through an organized and automated system.

This system allows administrators and enrolment officers to create and maintain student profiles, manage course details, and handle student enrolment in various courses. It also enables instructors to view assigned courses and track the list of students enrolled in their classes. By storing all the information in a centralized Salesforce environment, the system ensures easy access to data and better coordination between different departments.

The project also covers the implementation of automation features such as validation rules, approval processes, and workflow automation to ensure that enrolment activities follow a proper structure. These automated processes help reduce manual errors and ensure that only valid and approved enrolments are processed.

2. IDEATION PHASE

2.1 Problem Statement (Customer Problem Statement Template)

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	Enrolment Officer	manage student enrolments efficiently	enrolment data is scattered	systems are manual and unintegrated	frustrated and error-prone
PS-2	Administrator	track enrolments and revenue	reporting is delayed	data is not centralized	uncertain in decision-making

2.2 EMPATHY MAP CANVAS

User Persona: Enrolment Officer

- Think & Feel: Concerned about double bookings and revenue loss
- Hear: Complaints from students and management
- See: Multiple spreadsheets and emails
- Say & Do: Rechecks data, follows up manually
- Pain: Duplicate entries, approval bottlenecks
- Gain: Automation, dashboards, faster processing

2.3 BRAINSTORMING & IDEA PRIORITIZATION

Step 1 – Brainstormed Ideas

- Spreadsheet automation
- Standalone enrolment portal
- ERP integration
- Salesforce-based enrolment system

Step 2 – Grouping

- Manual solutions
- Semi-automated solutions
- Fully automated cloud solutions

Step 3 – Prioritization

Salesforce-based SECMS was selected due to high feasibility and high impact.

3.REQUIREMENT ANALYSIS PHASE

3.1 CUSTOMER JOURNEY MAP

Stages covered:

- Awareness & Registration
- Course Selection
- Enrolment Request
- Fee Payment
- Approval
- Instructor Assignment
- Reporting & Completion

3.2 SOLUTION REQUIREMENTS

Functional Requirements

FR No	Epic	Description
FR-1	Student Management	Manage Student record
FR-2	Course Management	Create and manage courses
FR-3	Enrolment Processing	Request,approve,reject enrolments
FR-4	Instructor Assignment	Auto-assign instruction
FR-5	Reporting	Dashboards and reports

Non-Functional Requirements

NFR-1: Usability

The system shall provide a simple, intuitive, and user-friendly interface that enables

enrollment officers, administrators, instructors, and students to perform operations

efficiently with minimal training. Navigation shall be organized through clearly labeled

tabs, dashboards, and forms to reduce user effort and errors.

Examples:

● Quick student registration form

● One-click enrollment approval

● Role-based dashboards

NFR-2: Security

The system shall ensure the confidentiality, integrity, and protection of student and

institutional data through secure authentication, authorization, and access controls.

Sensitive information such as personal data, enrollment history, and academic records

shall only be accessible to authorized users.

Examples:

● Only admins can modify course details

● Instructors view only assigned students

● Students cannot access other student records

NFR-3: Reliability

The system shall operate consistently and accurately without failures during enrolment

processing, approvals, and reporting. Automation logic shall execute correctly to avoid

duplicate or incorrect enrolments.

Examples:

● No duplicate course registration

● Accurate status updates after approvals

● Consistent report generation

NFR-4: Performance

The system shall provide fast response times for all operations to ensure smooth and

uninterrupted user experience, especially during peak admission periods.

Examples:

● Quick dashboard refresh

● Fast search for student records

● No lag during bulk uploads

NFR-5: Scalability

The system shall support future growth in the number of students, courses, departments,

and users without degradation in performance or functionality. It shall allow easy addition

of new modules and features.

Examples:

● Add new departments without redesign

● Handle increased admissions annually

● Extend to mobile or portal integration

NFR-6: Availability

The system shall be continuously accessible to users during institutional working hours

and must minimize downtime. The platform shall support high availability for academic

operations.

Examples:

● 24/7 cloud access

● Reliable during peak admission season

● Automatic backup of student records

3.3 DATA FLOW DIAGRAM

● User inputs student and enrolment data

● System validates and stores records

● Approval process routes data

● Reports and dashboards consume processed data.

The system processes enrolment requests, validates data, routes approvals, assigns

instructors, and generates reports.

3.4 TECHNOLOGY STACK

Layer	Technology
UI	Salesforce Lightning
Logic	Salesforce Flows
Database	Salesforce Objects
Automation	Validation Rules, Approval Process
Reporting	Reports & Dashboards

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

SECMS directly addresses fragmented enrollment workflows by aligning user behavior, constraints, and automation using Salesforce-native capabilities.

4.2 Proposed Solution

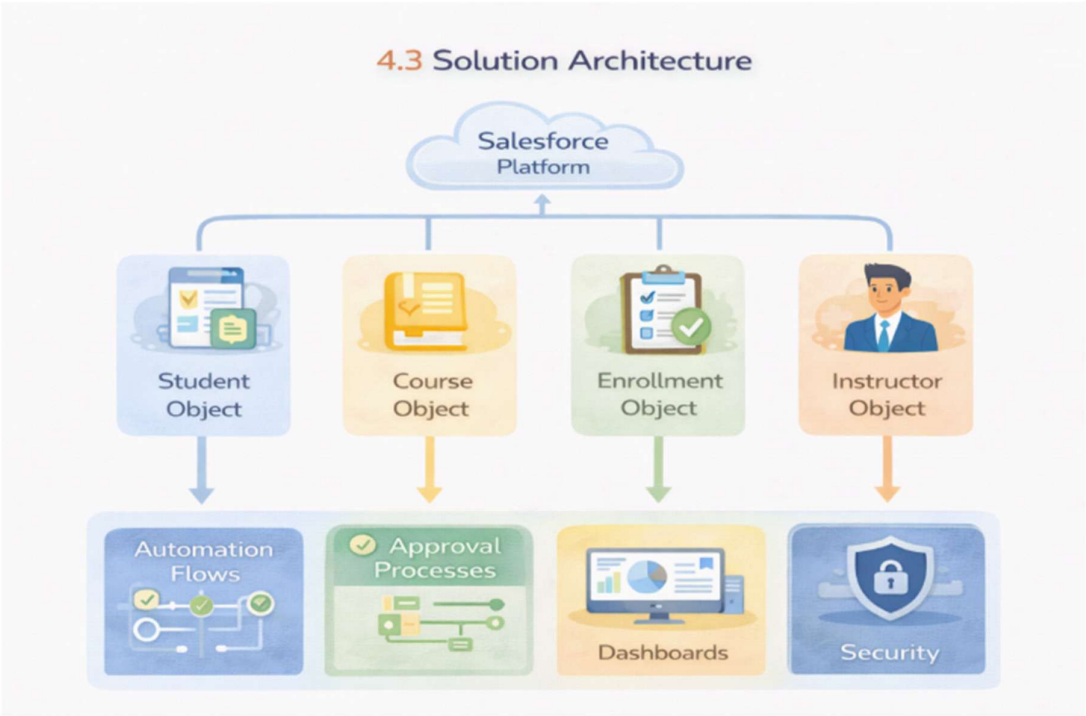
Functional Requirements

Parameter	Description
Problem	Manual enrollment handling
Solution	Salesforce-based SECMS
Novelty	End-to-end automation
Social Impact	Improved student experience
Social Impact	Institutional deployment
Scalability	Multi-department support

4.3 SOLUTION ARCHITECTURE

The architecture integrates Salesforce objects, automation flows, approval processes,

dashboards, and security layers.



5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

- Agile methodology
- Epics → Stories → Story Points
- Sprint-based execution
- Velocity calculation used for estimation

Product Backlog, Sprint Schedule, and Estimation (4 Marks)

Use the below template to create product backlog and sprint schedule

Project planning and scheduling play an important role in ensuring the successful completion of the **Student Enrollment and Course Management System (SECMS)** developed using Salesforce. Proper planning helps in organizing tasks, managing resources efficiently, and completing the project within the given time frame. The project was divided into several phases, starting from requirement analysis to final implementation and testing.

During the **planning phase**, the project objectives, system requirements, and expected outcomes were clearly identified. The main goal was to design a system that can manage student data, course information, enrollments, instructor assignments, and reporting within a single Salesforce platform.

After defining the requirements, the project development process was scheduled into different stages. Each stage focused on specific activities such as system design, object creation, automation setup, and testing. This structured approach helped in monitoring the progress of the project and ensured that every module was developed and implemented effectively.

6. Project Development Phase:

Project Flow:

1.Salesforce Developer Account Creation

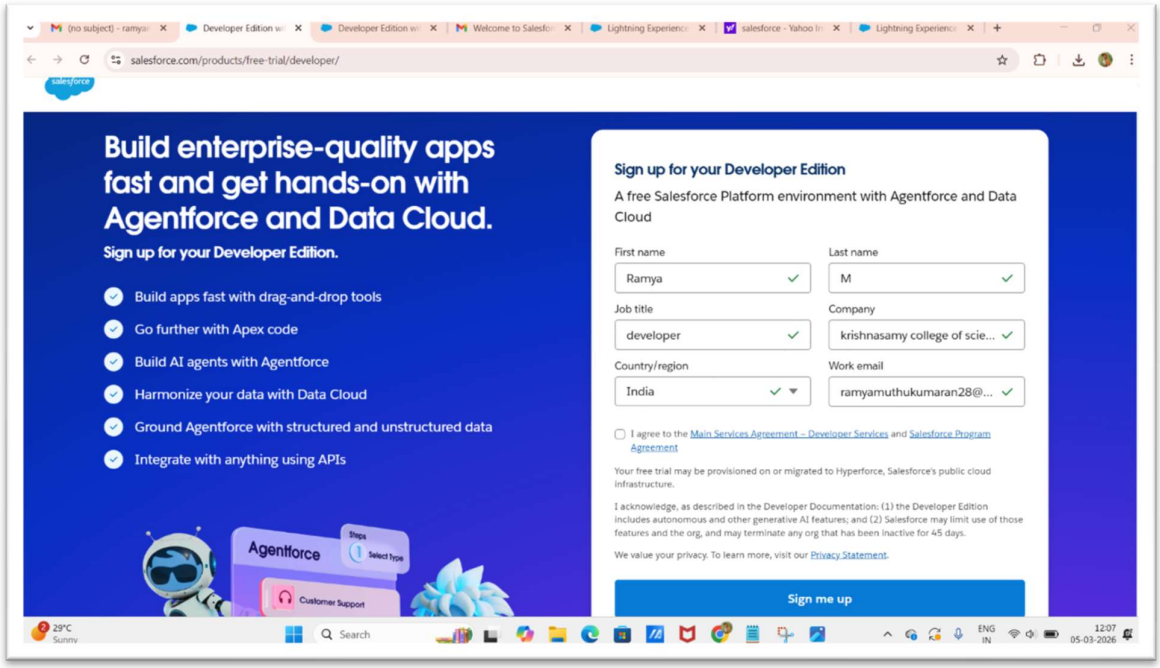
The first step in developing the Student Enrollment and Course Management System (SECMS) is creating a Salesforce Developer Account. A Salesforce Developer Account provides a free environment where developers can build, test, and deploy custom applications using the Salesforce platform. This environment includes access to various Salesforce features such as custom objects, automation tools, reports, dashboards, and security configurations, which are essential for building the project.

To begin the development process, a developer account must be created through the Salesforce developer website. This account allows users to access the Salesforce Lightning platform, where all system configurations and development activities are performed.

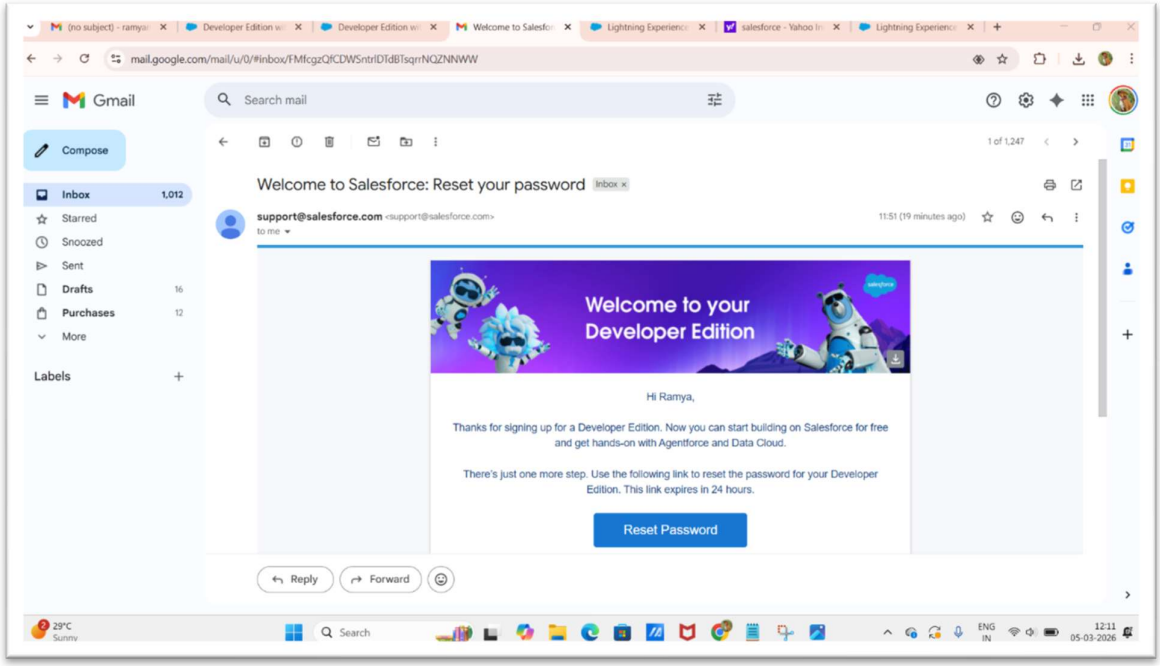
Steps to Create a Salesforce Developer Account

1. Open a web browser and visit the Salesforce developer signup page: https://developer.salesforce.com/signup
2. Fill in the required information in the registration form:
    - First Name and Last Name
    - Email Address
    - Role: Developer

- Company Name: College Name
- Country: India
- Postal Code: Enter your area pin code
- Username: A unique username in email format (for example: username@organization.com)



3. After entering all the details, click on the Sign Me Up button to submit the registration form.
4. Salesforce will send a verification email to the registered email address. Open the email inbox and click the Verify Account link to activate the developer account.
5. Once the account is verified, create a password and security question to complete the setup process.
6. After completing these steps, the user will be redirected to the Salesforce Setup Page, which serves as the main interface for configuring objects, fields, automation, and other system components.



2.Custom Object Creation (Student, Course, Enrollment, Instructor)

In Salesforce, custom objects are used to store and manage specific data related to an application. For the Student Enrollment and Course Management System (SECMS), custom objects were created to organize and maintain information about students, courses, enrollments, and instructors. These objects help structure the system and enable efficient data management within the Salesforce platform.

The main custom objects created for this project are Student, Course, Instructor, and Enrollment. Each object stores specific information and is connected to other objects through relationships, allowing the system to track the entire enrollment process.

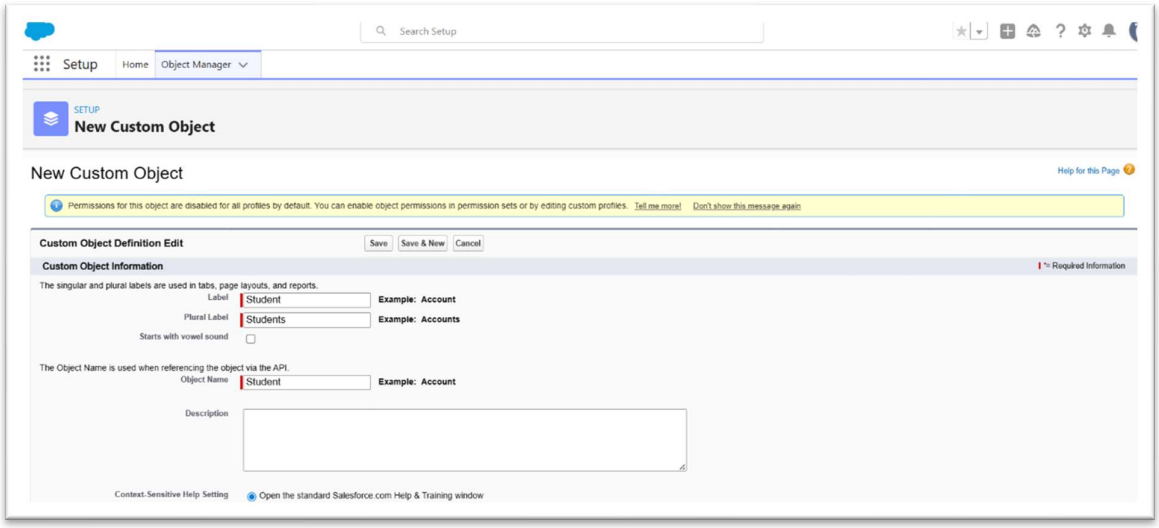
1. Student Object

The Student object is used to store details related to students who register in the system. This object contains information such as student name, email, phone number, date of birth, and enrollment status. It helps administrators manage student records and track their academic activities.

Example fields in the Student object include:

- Student Name
- Email

- Phone
- Date of Birth
- Student Status
- Address



2. Course Object

The Course object stores information about the courses offered by the institution. It includes details such as course name, category, duration, course fee, and course description. This object helps administrators manage and organize different courses available for students.

Example fields in the Course object include:

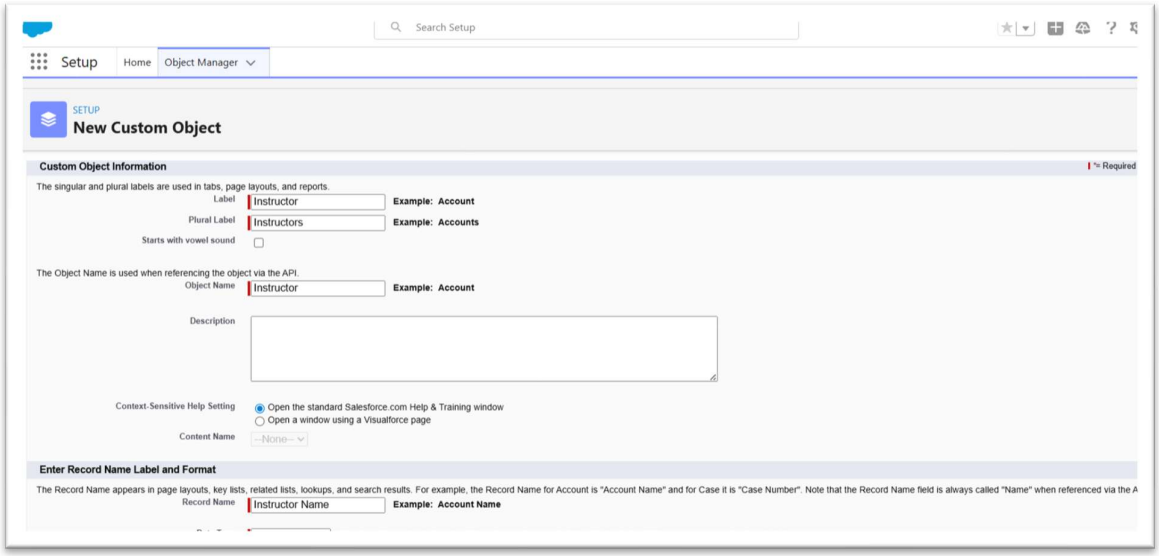
- Course Name
- Category
- Duration
- Course Fee
- Description

3. Instructor Object

The Instructor object maintains details of instructors responsible for teaching different courses. This object helps assign instructors to courses and manage their contact details and expertise.

Example fields in the Instructor object include:

- Instructor Name
- Instructor Code
- Expertise
- Phone
- Email



4. Enrollment Object

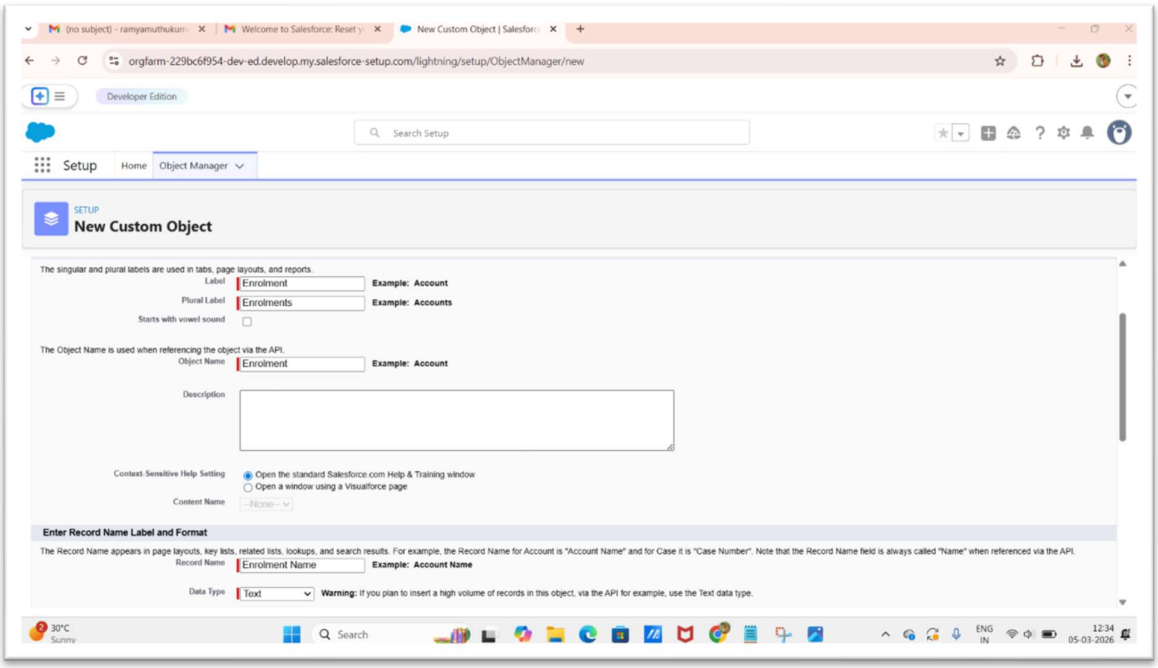
The Enrollment object is used to manage the enrollment process of students into courses. This object connects the Student, Course, and Instructor objects through lookup relationships. It also stores information about enrollment date, status, payment details, and comments.

Example fields in the Enrollment object include:

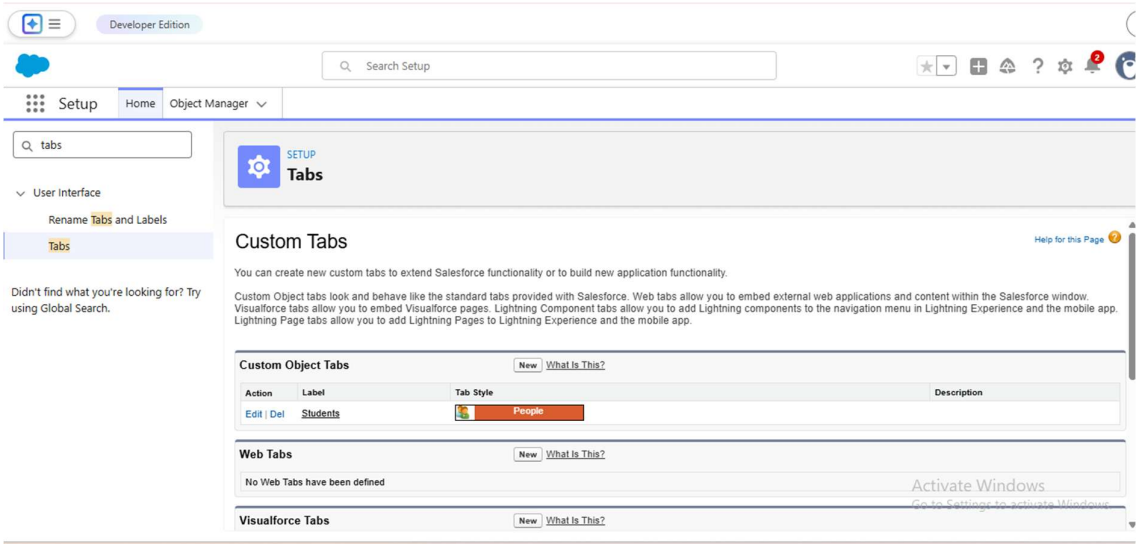
- Student (Lookup to Student)
- Course (Lookup to Course)
- Instructor (Lookup to Instructor)
- Enrollment Date
- Enrollment Status

- Fees Paid
- Total Amount
- Comments

By creating these custom objects, the system can efficiently manage academic information and maintain relationships between students, courses, instructors, and enrollments. This structured data model forms the foundation of the Student Enrollment and Course Management System developed using Salesforce.



3.Tabs Creation



In Salesforce, tabs are used to provide easy access to objects and their records within the application interface. Tabs act as navigation elements that allow users to quickly open and manage data stored in custom objects. For the Student Enrollment and Course Management System (SECMS), tabs were created for the main objects so that administrators and enrollment officers can easily access and manage information related to students, courses, instructors, and enrollments.

Creating tabs improves the usability of the application by organizing different sections of the system in a clear and structured way. Each tab represents a specific object and displays the records associated with that object.

Steps to Create Tabs in Salesforce

1. Go to the Setup page in Salesforce.
2. In the Quick Find search box, type Tabs.
3. Under Custom Object Tabs, click New.
4. Select the required object from the object list (for example, Student).
5. Choose a Tab Style (icon) to represent the object visually.
6. Click Next.
7. Assign the tab to the required user profiles (such as Admin, Enrollment Officer, and Instructor).

8. Click Next, review the settings, and then click Save.

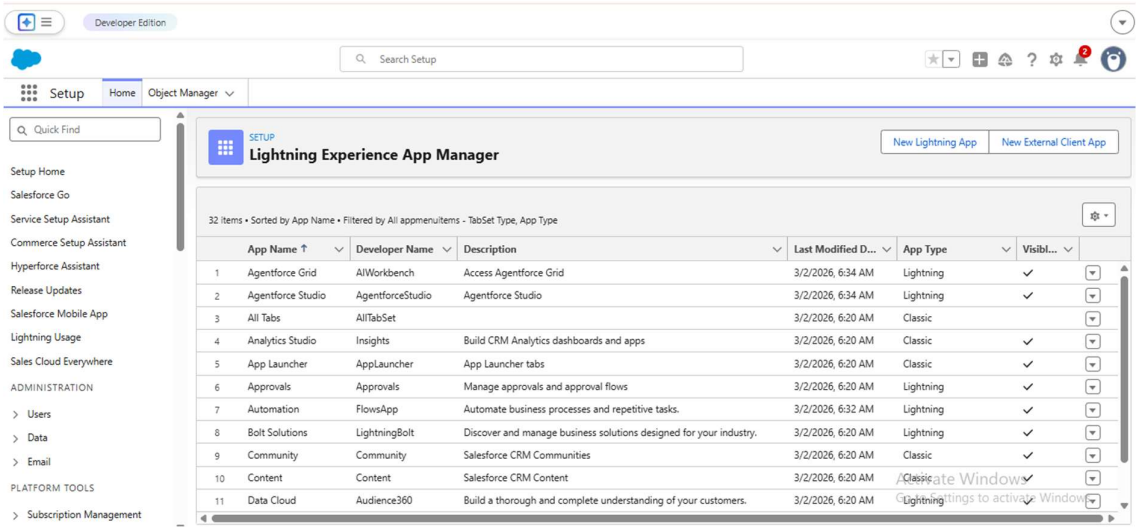
Tabs Created for the Project

The following tabs were created for the SECMS application:

- Student Tab – Used to manage student records and personal details.
- Course Tab – Used to view and manage available courses.
- Instructor Tab – Used to maintain instructor information and expertise.
- Enrollment Tab – Used to handle student enrollments and track course registrations.

By creating these tabs, users can easily navigate through different sections of the system and perform tasks such as adding new records, updating existing data, and monitoring enrollment activities efficiently. The tabs also help in improving the overall user experience of the Salesforce application.

4. Lightning App Creation



The Lightning App is created to organize all the objects and features of the system in one place. It provides a user-friendly interface where users can easily access different parts of the application. In this project, a Lightning App named Student Enrollment & Course Management System was created.

The app includes important tabs such as Student, Course, Instructor, Enrollment, Reports, and Dashboards. These tabs help administrators and enrollment officers manage academic operations efficiently. The Lightning App also allows role-based access so that users can perform tasks according to their responsibilities.

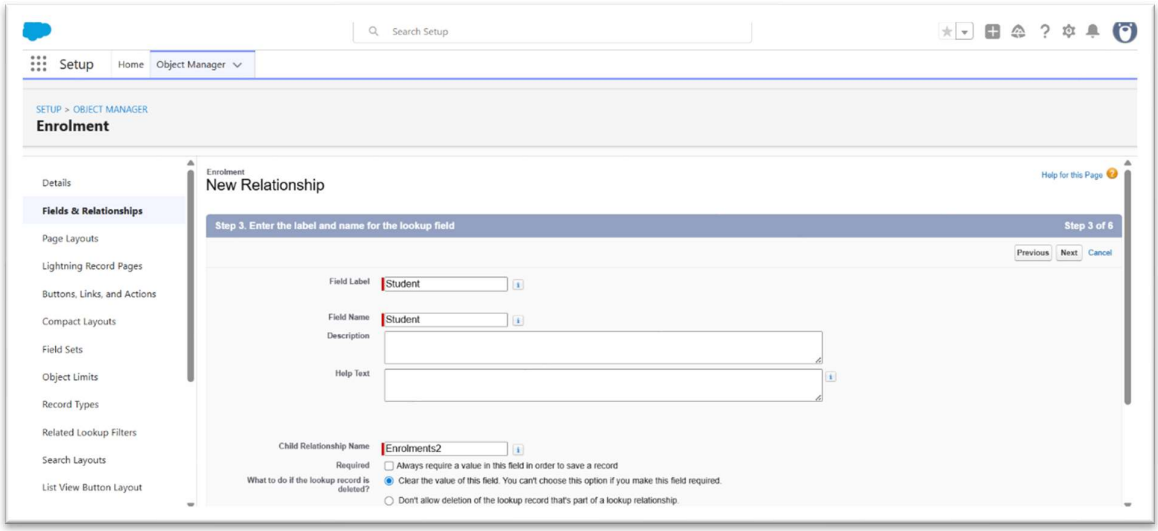
5. Fields Creation

Fields are used to store specific information inside objects. After creating the custom objects, different fields were added to capture detailed data related to students, courses, instructors, and enrollments.

For example, the **Student object** contains fields like Student Name, Email, Phone, Date of Birth, and Student Status. The **Course object** includes fields such as Course Name, Category, Duration, and Course Fee. Similarly, the **Enrollment object** includes fields like Enrollment Date, Enrollment Status, Fees Paid, and Total Amount.

These fields help store and manage accurate information within the system.

6.Create Relationships



Relationships in Salesforce connect different objects and allow them to share information with each other. In this project, relationships were created to link students, courses, instructors, and enrollments.

Lookup relationships were created from the **Enrollment object** to the **Student, Course, and Instructor objects**. This allows the system to track which student enrolled in which course and which instructor is assigned to that course.

These relationships help maintain structured data and improve the overall functionality of the system.

7.Page Layout Customization

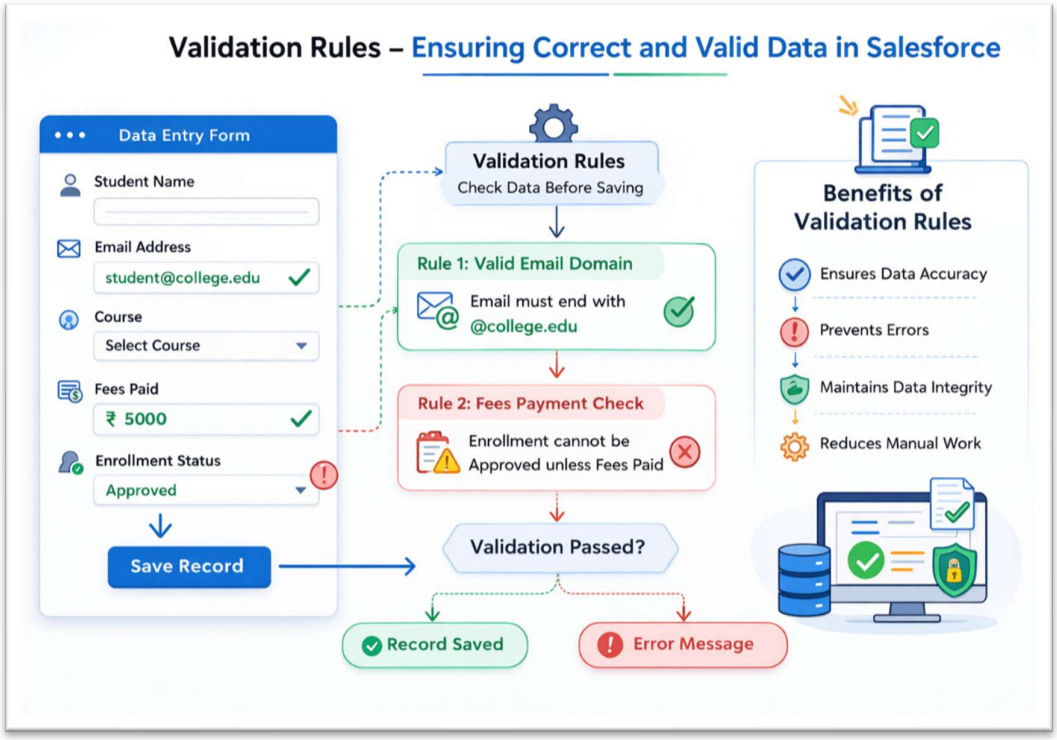
Page Layout Customization in Salesforce is used to organize how fields, sections, and related lists appear on an object's record page. It helps users view and enter information in a clear and structured format. By customizing page layouts, only the most relevant fields are displayed to users, which improves usability and reduces data entry errors.

In the Student Enrollment and Course Management System (SECMS), page layouts were customized for the main objects such as Student, Course, Instructor, and Enrollment. Important fields like student details, course information, enrollment status, and payment details were arranged in a logical order so that users can easily access and update records.

Separate layouts were also created for different Enrollment record types, such as New Enrollment and Re-Enrollment, so that only relevant information is shown depending on the enrollment type. Additionally, related lists were added to parent objects like Student, Course, and Instructor to display all associated enrollment records.

Through page layout customization, the system provides a more organized interface, making it easier for administrators and enrollment officers to manage academic records efficiently.

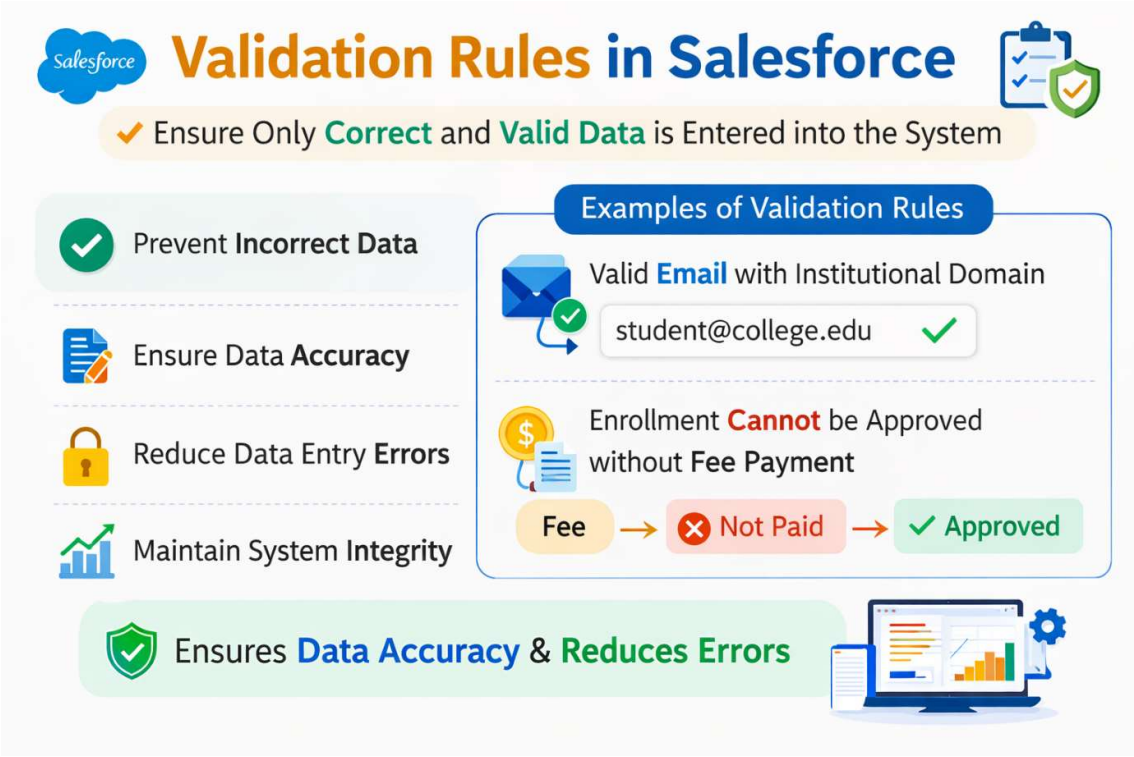
8.Validation Rules



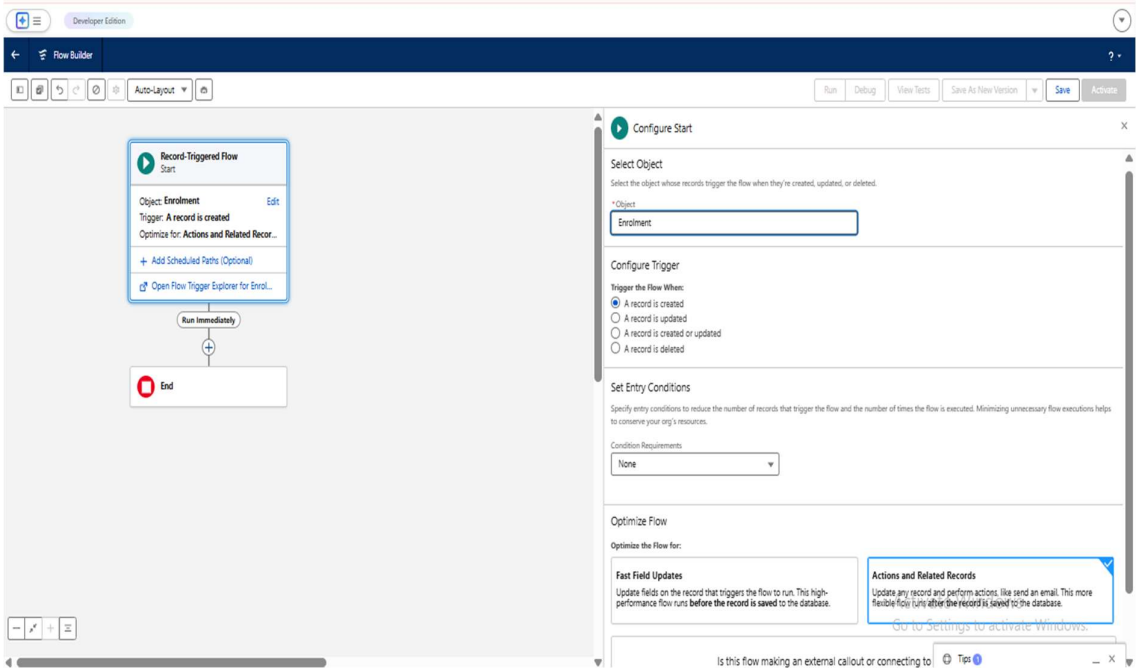
Validation Rules are used to ensure that only correct and valid data is entered into the system. They prevent users from saving incorrect or incomplete records.

For example, a validation rule was created to ensure that students enter a valid email address with the institutional domain. Another validation rule checks that enrollment cannot be approved unless the course fees have been paid.

These rules help maintain data accuracy and reduce errors in the system.



9.Flows (Automation)



The Flow Builder in Salesforce is used to automate various processes in the Student Enrollment and Course Management System (SECMS). Automation helps reduce manual work and ensures that system operations are performed automatically when certain conditions are met.

In this project, a Record-Triggered Flow was created to automate the enrollment process. This flow is triggered whenever a new record is created in the Enrollment object.

When a new enrollment record is added to the system, the flow automatically performs specific actions such as updating fields, assigning instructors, and managing the enrollment status. This ensures that the enrollment process is handled efficiently without requiring manual intervention from administrators.

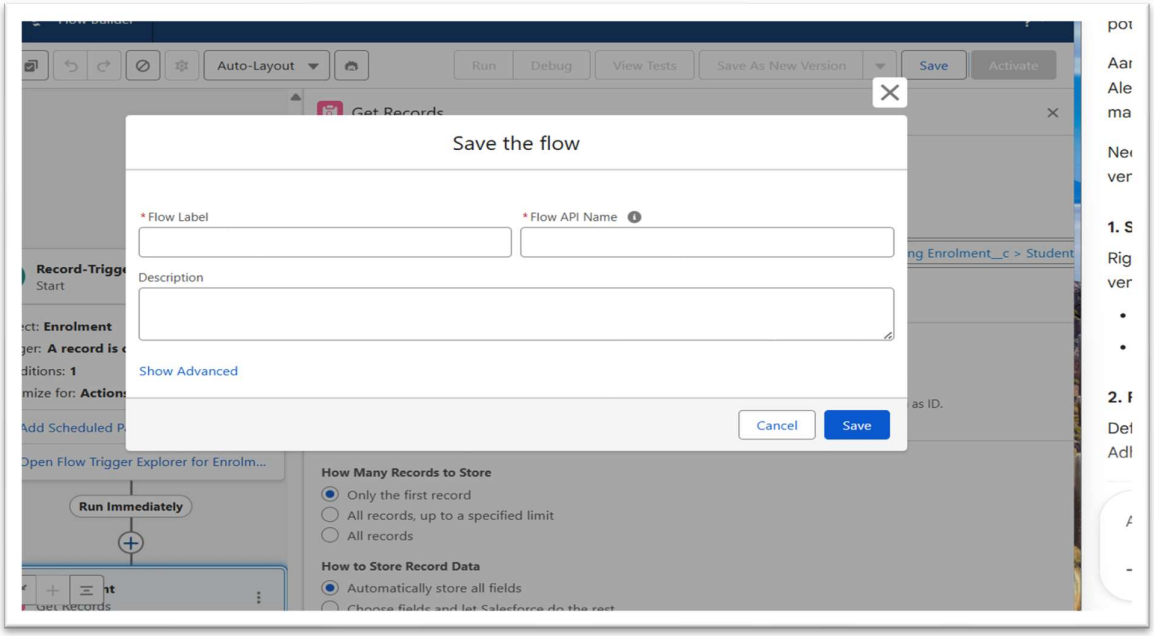
The flow begins with a Start element, where the object is selected as Enrollment. The trigger condition is set to “A record is created”, which means the flow will run automatically whenever a new enrollment record is created in the system.

The flow is configured to run immediately after the record is created. This allows the system to perform actions such as updating related records, sending notifications, or assigning instructors automatically.

Using Salesforce Flow Builder provides several advantages:

- It automates repetitive tasks within the system
- It reduces manual data entry errors
- It ensures consistent execution of business processes
- It improves system efficiency and productivity

By implementing automation using Flow Builder, the Student Enrollment and Course Management System becomes more efficient and reliable, allowing administrators and enrollment officers to manage academic processes smoothly.



10.Approval Process

The **Approval Process** is used to control and manage enrollment approvals in the system. When a student requests enrollment for a course, the request is sent to the **Training Manager or Administrator** for approval.

The administrator can either approve or reject the request. If the request is approved, the enrollment status is updated to **Approved**. If it is rejected, the system updates the status to **Rejected** and sends a notification to the student.

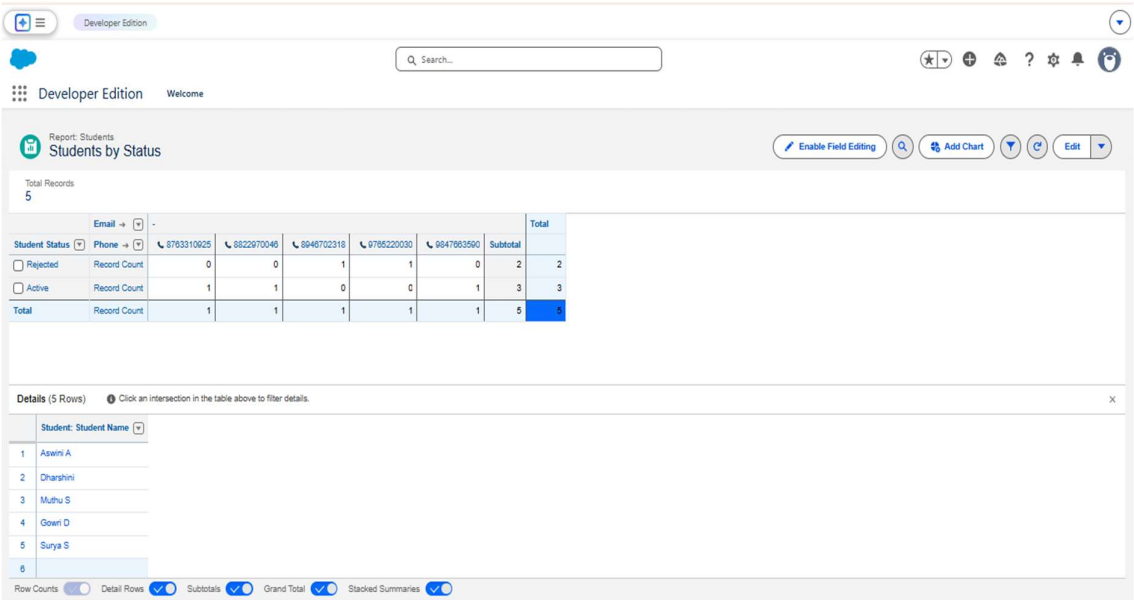
This process ensures that all enrollments are properly verified before confirmation.

11. Reports

Reports play an important role in analyzing and monitoring the data stored in the Student Enrollment and Course Management System (SECMS). In Salesforce, reports are used to organize, filter, and present data in a structured format so that administrators and managers can easily understand system performance and make better decisions.

In this project, several reports were created to track important information such as student enrollment status, course registrations, pending approvals, and revenue generated from course fees. These reports help administrators quickly identify trends, monitor academic activities, and ensure that the enrollment process is running smoothly.

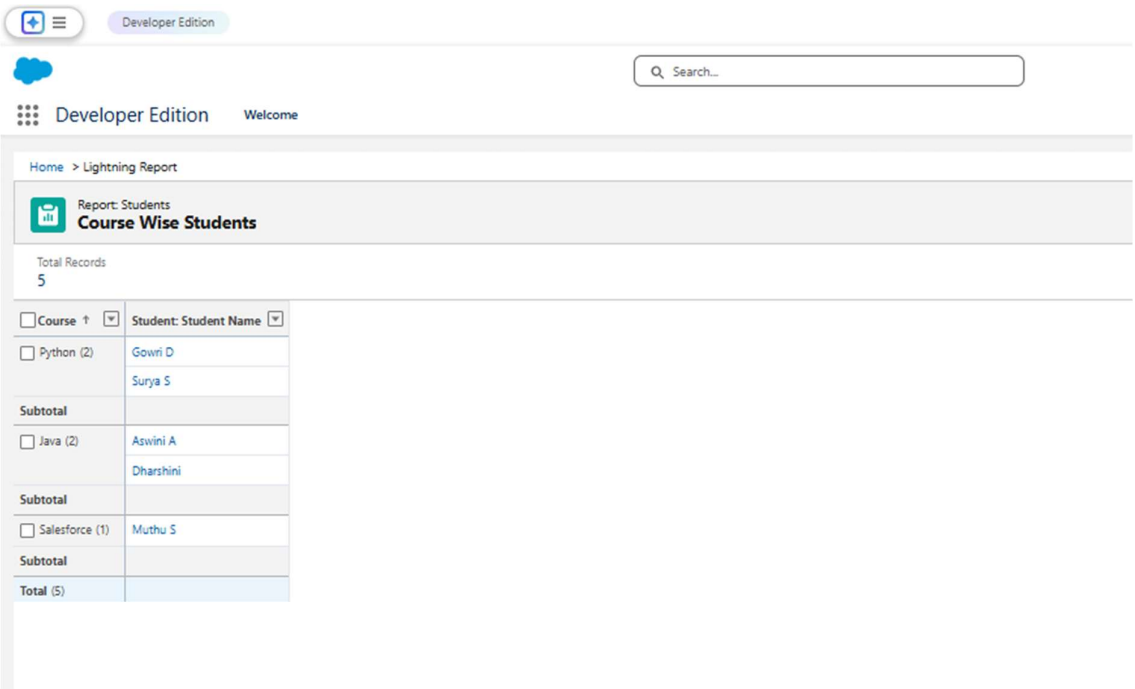
Students by Status Report



The “Students by Status” report provides information about the current status of students in the system. Students may have different statuses such as Active, Inactive, or Pending. By grouping students based on their status, administrators can easily understand how many students are currently active in courses and how many are yet to complete the enrollment process.

This report helps the management track the distribution of student records and identify any delays or issues in student enrollment activities.

Enrollments by Course Report



The “Enrollments by Course” report shows the number of students enrolled in each course offered by the institution. This report helps administrators analyze which courses are more popular among students and which courses have fewer enrollments.

By reviewing this report, management can make decisions about introducing new courses, improving existing ones, or allocating instructors more efficiently.

Pending Enrollment Approvals Report

The “Pending Enrollment Approvals” report displays all enrollment requests that are waiting for approval from the administrator or training manager. This report helps ensure that enrollment requests are processed on time and prevents delays in the registration process.

Administrators can use this report to quickly identify pending requests and take necessary actions such as approving or rejecting them.

Revenue Report

The Revenue Report provides information about the total fees collected from course enrollments. It helps the institution track the income generated through different courses. This report is useful for financial monitoring and helps the management analyze the financial performance of the academic programs.

By reviewing revenue reports regularly, institutions can plan budgets, evaluate course profitability, and improve resource allocation.

Overall, reports provide valuable insights into system activities and support data-driven decision making in the Student Enrollment and Course Management System.

12. Dashboards

Dashboards in Salesforce provide a visual representation of important data using charts, graphs, and tables. They help administrators and managers quickly understand system performance without having to read large reports. Dashboards make it easier to analyze trends and monitor key metrics in real time.

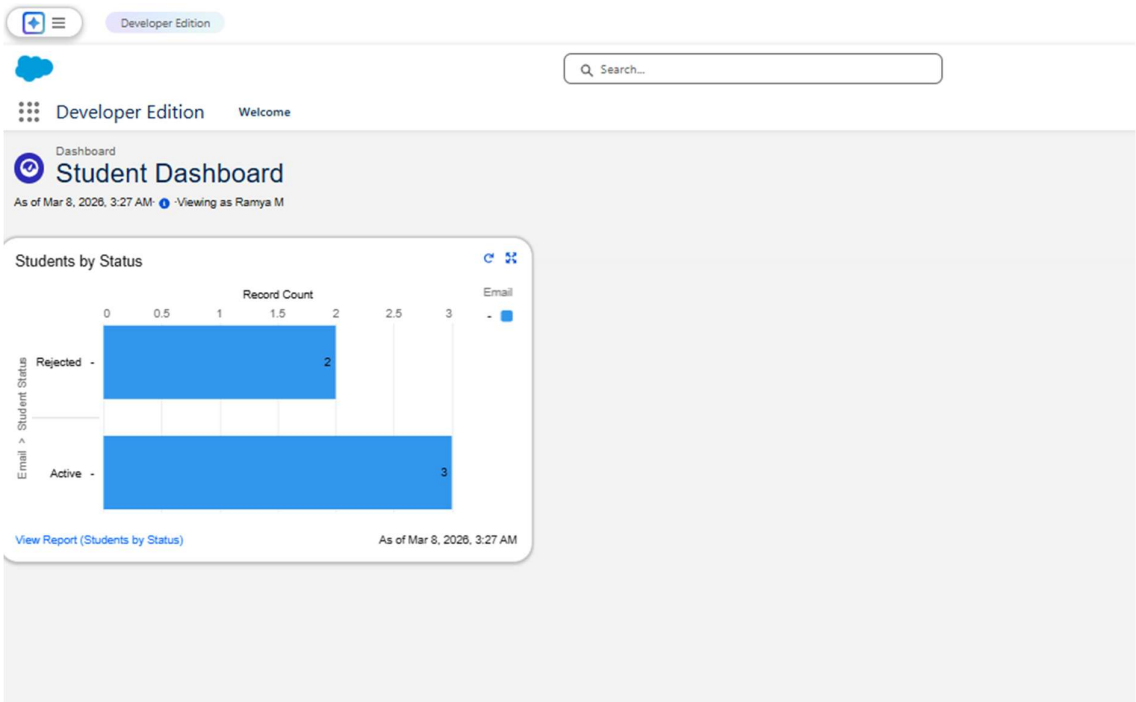
In the Student Enrollment and Course Management System (SECMS), dashboards were created to display important information such as student enrollment statistics, course registration trends, revenue data, and pending approval requests.

Student Management Dashboard

The main dashboard created for this project is the Student Management Dashboard. This dashboard combines multiple reports into one visual interface so that administrators can monitor the overall system performance.

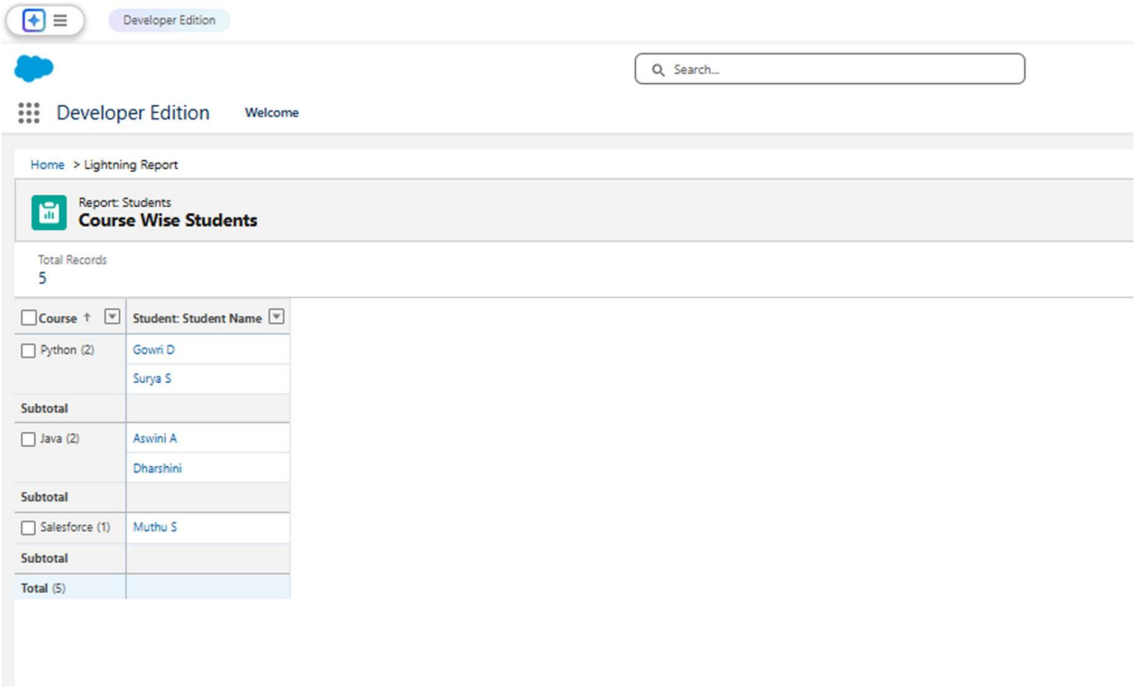
The dashboard includes the following components:

Barc chart-Students by Status



This chart shows the number of students based on their enrollment status such as Active, Inactive, or Pending. It helps administrators quickly understand the distribution of students in the system.

Table-Enrollments by Course



This table displays the number of students enrolled in each course. It helps identify the most popular courses and supports better course planning.

Table – Pending Enrollment Requests

This component displays a list of enrollment requests that are waiting for approval. It helps administrators quickly identify pending tasks and take necessary actions.

By using dashboards, administrators can easily monitor the performance of the Student Enrollment and Course Management System and make quick decisions based on real-time information.

13. Security Setup

Security is an important aspect of any system that handles sensitive information. The Student Enrollment and Course Management System stores important data such as student details, course information, and enrollment records. Therefore, proper security configurations were implemented to ensure that only authorized users can access and modify the data.

Salesforce provides several security features such as profiles, permission sets, and sharing settings to control user access.

User Profiles

Profiles define what actions a user can perform within the system. Different profiles were created in the SECMS application to ensure that users can only access information related to their roles.

The following profiles were configured for this project:

Administrator Profile

The administrator has full access to all system features. This includes creating and managing student records, courses, instructors, enrollments, reports, and dashboards. Administrators also manage system configurations and approval processes.

Enrollment Officer Profile

Enrollment officers are responsible for managing student registrations and enrollment activities. They can create and update student records, process enrollment requests, and manage course registrations.

Instructor Profile

Instructors have limited access to the system. They can view the courses assigned to them and see the list of students enrolled in their classes. However, they cannot modify student or course information.

Permission Sets

Permission sets were used to provide additional access rights to specific users when required. For example, some users were given permission to create and customize reports and dashboards.

Sharing Settings

Sharing settings control how records are shared between users. In this project, organization-wide default settings were configured to ensure that sensitive data remains protected while still allowing authorized users to collaborate effectively.

By implementing these security measures, the system ensures that student and institutional data remains safe and accessible only to authorized users.

14. Functional and Performance Testing

Testing is an important step in the development of any system. It ensures that the application functions correctly and meets the project requirements. In the Student Enrollment and Course Management System (SECMS), testing was performed to verify that all features work as expected.

During the testing phase, different components of the system were tested, including student record creation, course management, enrollment processing, automation flows, validation rules, and reporting features.

Functional Testing

Functional testing was conducted to verify that all system features operate correctly. The following activities were tested:

- Creation of student records and verification of stored information.
- Creation and management of course records.
- Enrollment of students into courses.
- Validation rules to ensure that only correct data is entered.
- Approval processes for enrollment requests.
- Automation flows for setting enrollment dates and sending notifications.
- Reports and dashboards for monitoring data.
- Screenshots were captured during testing to confirm that each feature was functioning properly.

Performance Testing

Performance testing was conducted to ensure that the system responds quickly and efficiently even when handling multiple records. The system was tested for tasks such as searching student records, generating reports, and loading dashboards.

The results showed that the Salesforce platform provides fast response times and can handle academic data efficiently without delays.

Overall, the testing process confirmed that the Student Enrollment and Course Management System functions correctly and meets the required project objectives.

15. Advantages and Disadvantages

Advantages

- The Student Enrollment and Course Management System provides several advantages for educational institutions.
- One of the major advantages is centralized data management. All information related to students, courses, instructors, and enrollments is stored in a single Salesforce platform. This makes it easy for administrators to access and manage records.
- Another advantage is automation. The use of Salesforce features such as flows, validation rules, and approval processes reduces manual work and improves efficiency.
- The system also provides real-time reporting and dashboards, which help administrators monitor academic activities and make better decisions.

Disadvantages

- Although the system offers many benefits, it also has some limitations. The system depends on the Salesforce platform, which means institutions must rely on cloud services for system access.
- Another limitation is the initial setup and configuration effort required to implement the system. Administrators must configure objects, fields, automation rules, and security settings before the system becomes fully operational.
- Despite these limitations, the system provides significant improvements over traditional manual enrollment processes.

7.CONCLUSION

The Student Enrollment and Course Management System (SECMS) developed using Salesforce successfully automates and simplifies the academic enrollment process of an educational institution. The system provides an efficient platform for managing student records, course information, enrollment activities, instructor assignments, and academic reporting.

By implementing Salesforce features such as custom objects, validation rules, automation flows, approval processes, reports, and dashboards, the project demonstrates how cloud-based technologies can improve data management and operational efficiency.

The system reduces manual work, improves data accuracy, and ensures that enrollment activities follow a structured workflow. Administrators can easily monitor student registrations, track course enrollments, and analyze important metrics such as revenue and student status through reports and dashboards.

Overall, the SECMS application provides a reliable and scalable solution for managing academic enrollment operations and highlights the potential of Salesforce as a powerful platform for developing enterprise-level applications.
